### **Abstract:**

A child with disability cannot try harder, pay closer attention, or improve motivation on their own; they need help to learn how to do those things. Disabilities are caused by a difference in the brain that affects how information is received, processed, or communicated. Children and adults with learning disabilities have trouble processing sensory information because they see, hear, and understand things differently. Autism is a spectrum disorder, meaning that there is a wide degree of variation in the way it affects people. Every child on the autism spectrum has unique abilities, symptoms, and challenges. Learning about the different autism spectrum disorders will help us better understand these children. They have too good and positive points as all people. The only thing that we have to do is to look at them carefully and to understand them.

### **Presenter:**
